```python
from django.shortcuts import render

# load database into view
from .models import Listing

def index(request):
    # get all data from database
    listings = Listing.objects.all()
    # use variable to hold the dictionary ratjer than direct passing
    dictionary into function
    context = {
        'listings': listings
    }
    return render(request, 'listings/listings.html', context)

# add additional parameter listing_id route

def listing(request, listing_id):
    return render(request, 'listings/listing.html')

def search(request):
    return render(request, 'listings/search.html')
```
